The Moline side load duster-dispenser is designed to uniformly and efficiently dispense dry ingredients across the width of the dough sheet or conveyor.

The intake hopper is filled with dry ingredient (such as flour or cornmeal). The hopper can be filled manually or from a bulk ingredient supply source. An auger pulls the ingredient from the intake hopper and distributes it across the length of the main hopper for even dispersal. An agitator keeps the dry ingredient moving smoothly. Sensors detect ingredient levels and signal for more ingredient when levels are low. This provides even dispersion and is useful on wide conveyors or in hard to reach locations since the intake hopper is filled at the side of the machine.

The flow adjustment assembly controls the dispensing pattern. The dispersion rate is adjusted with agitator speed and slide position. Quick release clamps retain the flow adjustment assembly which can be easily lowered for cleaning. The intake hopper can also be easily emptied of residual dry ingredient by releasing the two clamps and rotating it back.

Electrical specifications vary depending on customer requirements. The frame, mounted on casters, provides easy sanitation and mobile flexibility.

• The intake hopper, positioned for easy side loading, provides efficient access and improved operator safety. Easily refilled during production without reaching or spilling.

• Can be used with a customer-provided ingredient supply source for continuous ingredient dispersion.

• Accommodates conveyor widths from 18” to 60”.

For automatic and continuous application of dry ingredients such as flour or cornmeal.
Side Load Duster-Dispenser

Features

- **Construction:**
  Stainless steel construction with precision machined components.

- **Available Sizes:**
  Accommodates 18” to 60” wide conveyors.

- **Guards and Covers:**
  Guards contain safety switches to prevent access to the agitator and auger during operation but allow easy access for sanitation when the machine is shut down.

- **Agitator/Auger Speed Adjustment:**
  Speeds are controlled through a controller (DC machines) or through the production system’s operator interface (AC machines).

- **Flow Adjustment:**
  Flow adjustment slides are pulled out or pushed in to alter the dry ingredient dispersion pattern as necessary during production.

- **Drive Systems:**
  Variable speed direct drives for both auger and agitator.

- **Electrical System:**
  230 Volt, 60 Hertz, 3 Phase. Other electrical options are available.

Optional Auto-Fill System

The optional auto-fill system efficiently maintains ingredient levels in the dispenser intake hopper, providing continuous and automatic ingredient dispersion to the product. Ingredient is continuously provided by a customer-supplied delivery system. The intake hopper ingredient level is maintained by level sensors mounted to the hopper which signal for more ingredient from the delivery system as levels decrease. This provides a continuous, automated ingredient application for high-volume production systems while requiring minimal labor and very little downtime.

Due to continuous product improvement, specifications are subject to change without notice.
